weights and three scales, automatically align with text, and can be edited using vector graphics tools to create custom symbols with characteristics and accessibility features. SF Symbols 7 introduces and variable rendering, enhanced Magic Replace, gradients, and new symbols.

Draw

Draw On and Draw Off are new animation presets inspired by the calligraphic movement designed to let symbols more expressively animate into and out of your app's interface. To leverage a symbol's layer structure, combined with new annotation and timing choreography, a symbol's movement. Multiple playback options offer flexibility for various contexts: Whole layers together in a single, swift movement; By Layer offsets the start time of each layer to create a dynamic effect; and Individually animates one layer at a time for a more deliberate reveal.

New annotation

New annotation tools make it easy to create Draw animations for custom symbols with just a few guide points on layers to control how a path draws from beginning to end. Guide point placement is automatically translated across weights and can be customized in Ultralight, Regular, and Bold weights to control movement across all symbol weights and scales. Create bespoke animations tailored to your symbols by leveraging draw attachments, optional bi-directionality, adaptive end caps, and more.

Variable Draw

Variable Draw extends the capabilities of Variable Color by conveying strength or progress, direction, and resolution. Symbols annotated to support Draw animations can optionally support Variable Draw on individual layers to function as informative and dynamic progress indicators.

Enhanced Magic Replace

Magic Replace now provides greater continuity when animating between related symbols. When using an enclosure shape, Magic Replace preserves the enclosures while the remaining symbols transition according to the preset configuration. Additionally, symbols that support Draw will automatically Draw On during Magic Replace transitions.

Gradients

Gradients are commonly used to add depth, dimension, and visual interest to a symbol. Most software automatically generates a smooth linear gradient from a single source color, which can be selected from a color system or custom colors. Gradients elevate symbols with a greater sense of lighting and depth. Gradients are rendered using various rendering modes.

New symbols

SF Symbols 7 features hundreds of new symbols and design updates to existing symbols in Apple's new universal design language. New localized symbols include variants across Latin, Hebrew, Arabic, Chinese, Japanese, Korean, Thai, Devanagari, as well as several Indic scripts. All new symbols are available in apps running iOS 26, iPadOS 26, macOS 26, watchOS 26, tvOS 26, and visionOS 26.
